

Git for an AI
driven future

<https://git3.io>

Problem

Today's code hosting is centralized and fragile.
Developers risk losing access, ownership and
revenue from their own creations

Solution

We're bringing Git on-chain, where developers truly own their repositories, can't be censored and can earn from their code

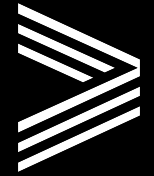

How it works

- Each repository is stored on-chain as an NFT.
- Blockchain ensures integrity and permanence.
 - Developers can set clone or access prices.
 - Transparent, trustless code verification.

Vampire Attack

We're not competing with Github, we're extending it. Instead of asking developers to switch tools, Git3 runs invisibly through a GitHub Action that brings code on-chain, instantly and effortlessly.

Product

Git3 v0.1.0 - Git. But trustless

Git3 makes repositories permanent, verifiable and independent of any central server by using MegaETH as the storage and verification layer.

Today, every Git repository ultimately lives on someone's server – GitHub, GitLab, Bitbucket. You trust them to keep your code online, preserve history and not censor or remove it. That trust is invisible, but absolute.

Git3 removes that dependency.

Type 'help' for available commands

```
$ git3 import https://github.com/lucatropea/lucatropea
```

✓ Deploy Completed

Repository: **lucatropea/lucatropea**

Project ID: **C5QmFZRZM2wWynv2erSCwLuDBuiRhtjH2hbuPsNCoZ81**

Summary: **1 commits · 1 files**

Project Link:

Product

Each repository lives as a unique on-chain asset, extended through the x402 protocol, enabling agent interoperability and paving the way for a decentralized MCP (Model Control Plane).

MVP is Live: <https://git3.io>

Why now

Until now, scalable on-chain code storage was impossible.

New high-performance L2s like Irys (100K+ TPS, 1ms latency, low txn fees) finally make it viable.

Market Opportunity

The global developer economy exceeds \$500B+, but code hosting is still centralized and unmonetized. Git3 turns code into a new asset class, Code as an Asset (CAA). Unlocking a massive tam and coupled with 402 driven payment rails a continous stream for developers

Revenue Streams

Creator Fees

Every repository is minted as an NFT, similar to ENS for .eth domains; Git3 earns a creator fee on each primary or secondary sale.

Protocol Fees via x402

Each transaction executed through x402 agents on the marketplace includes a small protocol fee, aligning incentives between developers, users, and agents.

\$GIT3 Token

The token is used for marketplace payments. A portion of the token supply is allocated to the core team and long-term protocol development.

Agent Royalties

When AI agents execute or verify code through Git3, the protocol collects a micro-fee, while distributing royalties to the original developers.

Thank You!
